

Seattle Airport's Bagroom Baggage Screening System Upgrade

- Seattle Airport required an inline 100% Hold Bag Screening (HBS) system to provide completely automated security within an existing operational bagroom. The system was required by a set deadline as imposed by the Transportation Security Administration (TSA).
- Brock was brought into the project situation to support an effort already in development, but that was seriously behind scheduled milestones. Brock undertook the challenge of designing, developing, and deploying a complete, fully tested bag room Baggage Screening System within a tight four-month delivery schedule. Brock met the schedule deadline with a TSA approved HBS.
